

Problem Statement:

A leading online grocery shopping supermarket using a set of delivery units across the country to ship the orders on time. In last 3 years, they are operating multiple delivery units and now they want to understand their performance and forecast the expected on-time delivery rate of each unit in coming month.

The data provided to you was prepared using the orders delivery transaction data of a unit. Understand the data, build forecasting model which helps to predict the coming months delivery rate and evaluate your model.
